Hi,

The history of my knowledge of the Turbu-flow is:

While employed by Barmenco Pty. Ltd in WA from early 97 to Nov 03, I installed the 50220 unit into the water supply line to the camp at Kookynie Resources Mining Complex to control the problems caused by the calcium in the bore water, which was creating havoc to the water heaters, electric jugs, air conditioners, taps, etc.

I installed the unit late 97 so was able to observe its performance and effects until I left in 03.

I was very impressed with the improvements to the components in the system, so impressed I installed the small unit into our Motor home, this lead to a greater life span of the anodes in the water heater and stainless water tanks.

Kind regards,

Graeme Keller
